Structure

• Systems for providing effective management of peritoneal dialysis via interdisciplinary team

Process

- Identify patients with weekly Kt/Vurea < 1.7
- Explore root causes for low Kt/Vurea (e.g. loss of residual kidney function, change in membrane, etc)
- Manage dose of dialysis with changes to prescription to maintain appropriate weekly Kt/Vurea

Outcome

Decrease likelihood of hospitalizations and death

Result

- Improve quality of care
- Increase patient's quality of life
