

NATIONAL QUALITY FORUM

Measure Submission and Evaluation Worksheet 5.0

This form contains the information submitted by measure developers/stewards, organized according to NQF's measure evaluation criteria and process. The evaluation criteria, evaluation guidance documents, and a blank online submission form are available on the [submitting standards web page](#).

NQF #: 0570	NQF Project: Renal Endorsement Maintenance 2011
(for Endorsement Maintenance Review)	
Original Endorsement Date: Dec 04, 2009 Most Recent Endorsement Date: Dec 04, 2009 Last Updated Date: May 08, 2012	
BRIEF MEASURE INFORMATION	
De.1 Measure Title: CHRONIC KIDNEY DISEASE (CKD): MONITORING PHOSPHORUS	
Co.1.1 Measure Steward: IMS Health	
De.2 Brief Description of Measure: To ensure that members with chronic kidney disease (CKD) who are not on dialysis are monitored for blood phosphorus levels at least once annually.	
2a1.1 Numerator Statement: Members with phosphorus level blood tests during the measurement year.	
2a1.4 Denominator Statement: Members with at least 1 inpatient diagnosis of chronic kidney disease during the year prior to the measurement year or members with at least 2 diagnoses of chronic kidney disease in an outpatient setting during the measurement year or year prior (at least 1 of which must be during the year prior to the measurement year).	
All physicians who saw the patient during the measurement year are scored on this measure.	
2a1.8 Denominator Exclusions: Members who are on dialysis or in hospice during the measurement year. Members who were hospitalized during the numerator time frame and did not fulfill numerator criteria.	
1.1 Measure Type: Process	
2a1. 25-26 Data Source: Claims	
2a1.33 Level of Analysis: Clinician : Group/Practice, Clinician : Individual, Health Plan	
1.2-1.4 Is this measure paired with another measure? No	
De.3 If included in a composite, please identify the composite measure (title and NQF number if endorsed): N/A	

STAFF NOTES (issues or questions regarding any criteria)
Comments on Conditions for Consideration:
Is the measure untested? Yes <input checked="" type="radio"/> No <input checked="" type="radio"/> If untested, explain how it meets criteria for consideration for time-limited endorsement:
1a. Specific national health goal/priority identified by DHHS or NPP addressed by the measure (check De.5):
5. Similar/related endorsed or submitted measures (check 5.1):
Other Criteria:

Staff Reviewer Name(s):

1. IMPACT, OPPORTUNITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See [guidance on evidence](#).

Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1a. High Impact: H ● M ● L ● I ●

(The measure directly addresses a specific national health goal/priority identified by DHHS or NPP, or some other high impact aspect of healthcare.)

De.4 Subject/Topic Areas (Check all the areas that apply): Renal, Renal : Chronic Kidney Disease (CKD)

De.5 Non-Condition Specific (Check all the areas that apply): Population Health

1a.1 Demonstrated High Impact Aspect of Healthcare: A leading cause of morbidity/mortality

1a.2 If "Other," please describe:

1a.3 Summary of Evidence of High Impact (Provide epidemiologic or resource use data):

Approximately 26 million people in the US have chronic kidney disease (CKD),[1] and nearly 400,000 require dialysis.[2] CKD patients account for 27.6% of general Medicare expenditure.[3, 4] In addition, an estimated 80,000 people are diagnosed annually with CKD.[5,6]

Nearly all members with CKD would present with osteodystrophy, a disorder of bone remodeling, without appropriate monitoring and treatment for imbalances in calcium phosphate homeostasis.[7,8]

1b. Opportunity for Improvement: H ● M ● L ● I ●

(There is a demonstrated performance gap - variability or overall less than optimal performance)

1b.1 Briefly explain the benefits (improvements in quality) envisioned by use of this measure:

Bone mineral disorders are common in patients with chronic kidney disease, and have potential for severe adverse impact on both mortality and morbidity. The diagnosis of bone mineral disorders is dependent on laboratory testing of calcium, phosphorus, and parathyroid hormone. This measure assesses the lowest frequency of phosphorus measurement in patients with CKD, as advocated by national guidelines. Thus, the use of this measure would increase physician compliance with quality of care in the management of bone mineral disorders among patients with CKD.

1b.2 Summary of Data Demonstrating Performance Gap (*Variation or overall less than optimal performance across providers*): [**For Maintenance** – *Descriptive statistics for performance results for this measure - distribution of scores for measured entities by quartile/decile, mean, median, SD, min, max, etc.*]

A 2007 study examining adherence within a managed care setting to the Kidney Disease Outcomes Quality Initiative (K/DOQI) guidelines found that the percentages of patients with Stage 3, Stage 4 and Stage 5 CKD who received AT LEAST annual phosphorus testing were 26.7% 53.3% and 67.5%, respectively.[1] Additionally, rates of phosphorus testing are low regardless of provider specialty, but especially low among those seen by primary care providers. A 2008 study conducted on a privately insured population found that overall rates of phosphorus testing were low, but were significantly lower among those patients seen by internists, as compared to nephrologists (1.9%, vs 38.2%, P=0.0001).[2]

1b.3 Citations for Data on Performance Gap: [**For Maintenance** – *Description of the data or sample for measure results reported in 1b.2 including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*]

1b.4 Summary of Data on Disparities by Population Group: [**For Maintenance** – *Descriptive statistics for performance results for this measure by population group*]

Little research has been done regarding receipt of KDoQI guidelines among disadvantaged groups. However, it has been reported that CKD patients who are female, non diabetic and being treated by an internist (rather than a nephrologist) may be less likely to receive appropriate monitoring.[1,2]

1b.5 Citations for Data on Disparities Cited in 1b.4: [**For Maintenance** – *Description of the data or sample for measure results reported in 1b.4 including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*]

1c. Evidence (*Measure focus is a health outcome OR meets the criteria for quantity, quality, consistency of the body of evidence.*)

Is the measure focus a health outcome? Yes ☒ No ☐ **If not a health outcome, rate the body of evidence.**

Quantity: H ☐ M ☒ L ☐ I ☐ **Quality:** H ☐ M ☒ L ☐ I ☐ **Consistency:** H ☐ M ☒ L ☐ I ☐

Quantity	Quality	Consistency	Does the measure pass subcriterion 1c?
M-H	M-H	M-H	Yes <input checked="" type="radio"/>

L	M-H	M	Yes ● IF additional research unlikely to change conclusion that benefits to patients outweigh harms: otherwise No ●
M-H	L	M-H	Yes ● IF potential benefits to patients clearly outweigh potential harms: otherwise No ●
L-M-H	L-M-H	L	No ●
Health outcome – rationale supports relationship to at least one healthcare structure, process, intervention, or service			Does the measure pass subcriterion 1c? Yes ● IF rationale supports relationship
<p>1c.1 Structure-Process-Outcome Relationship (<i>Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome</i>):</p> <p>This measure assesses the annual laboratory measurement of blood phosphorus levels in patients with chronic kidney disease. This is a process measure. The laboratory measurement of blood phosphorus is the first step in identifying patients with bone mineral disorders in need of treatment. In the medical literature there is direct relationship between aberrant levels of Ca, PO₄ and PTH and disease.</p> <p>1c.2-3 Type of Evidence (<i>Check all that apply</i>): Clinical Practice Guideline</p> <p>1c.4 Directness of Evidence to the Specified Measure (<i>State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population</i>):</p> <p>The patient population addressed by measure is patients with chronic kidney disease without dialysis, and there are no differences between the measure focus and measure target population.</p> <p>1c.5 Quantity of Studies in the <u>Body of Evidence</u> (<i>Total number of studies, not articles</i>): There are numerous studies showing aberrancy of Ca, PO₄, and PTH measurements starting at chronic kidney disease stage three (Levin et al Kidney Int 2007, Melamed ML et al Nephrol Dial Transplant 2008). There are no studies indicating the appropriate frequency in which measurements of Ca, PO₄, or PTH should be followed in chronic kidney disease. The evidence regarding the frequency of measurements of Ca, PO₄ or PTH is based on expert opinion.</p> <p>1c.6 Quality of <u>Body of Evidence</u> (<i>Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events</i>): The Quality of the Body of the Evidence is low and is based on expert opinion. Despite lack of evidence from clinical trials, this recommendation is rated as a “strong” recommendation from KDIGO. The majority of studies demonstrating benefit come from trials involving populations of hemodialysis patients. However, a cross sectional population study done by Levin et al. consisting of 1800 patients found abnormalities in PTH, Calcium, and Phosphorous in the majority of patients with eGFR ≤ 60. No existing trials exist to support early monitoring / intervention in CKD stage III. However, based on the clear benefits exist for treatment found in the ESRD subpopulation, it is strongly recommended by NKF and KDIGO to begin monitoring Calcium, Phosphorous, and PTH at CKD stage III, as the risk of this intervention is low and the benefit is high.</p> <p>1c.7 Consistency of Results <u>across Studies</u> (<i>Summarize the consistency of the magnitude and direction of the effect</i>): There are no clinical trials demonstrating efficacy of evaluation or treatment of PTH, Calcium, and Phosphorous in CKD stage III.</p>			

1c.8 Net Benefit (*Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms*):

The benefit of laboratory monitoring of Ca, PO₄, and PTH would be timely diagnosis of metabolic bone disease. The harm of a laboratory blood draw is minimal.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? **Yes**

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: The recommendation for laboratory monitoring of Ca, PO₄, and PTH was graded by the National Kidney Foundation (NKF) and Kidney Disease Improving Global Outcome (KDIGO).

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: The National Kidney Foundation categorized their statements as "Evidence" or "Opinion". "Evidence" statements are backed by studies, and "Opinion" statements are based on expert consensus.

Kidney Disease Improving Global Outcome (KDIGO) grade the strength of their statement based on four factors: balance between desirable and undesirable effects, quality of the evidence, value and preferences, and cost. KDIGO assign a number and a letter to their consensus statements. Letter grade "A" statements are of high quality, "B" statements are of moderate quality, "C" statements are of low quality and "D" statements are of very low quality. Numeric grade gives the strength of recommendation. Level 1 grade means for patients that "Most people in your situation would want the recommended course of action and only a small proportion would not" and for clinician "Most patient should receive the recommended course of action." Level 2 grade means for patients that "The majority of people in your situation would want the recommended course of action, but many would not", and for clinicians "Different choices will be appropriate for difference patients. Each patient needs help to arrive at a management decision consistent with her or his values and preferences."

1c.13 Grade Assigned to the Body of Evidence: The NKF graded the body of evidence for CA, PO₄ and PTH monitoring starting in stage III kidney disease as "evidence" and frequency of measurement as "opinion". KDIGO graded the body of evidence for CA, PO₄ and PTH monitoring starting in stage III kidney disease as "1 C". Although KDIGO graded the evidence of this statement as "Low quality evidence", KDIGO gave this statement a level 1 recommendation implying that "most patients should receive the recommended course of action". KDIGO did not grade the frequency of measurement.

1c.14 Summary of Controversy/Contradictory Evidence: There is no contradictory evidence in the literature.

1c.16 Quote verbatim, the specific guideline recommendation (Including guideline # and/or page #):

National Kidney Foundation

1.1 Serum levels of calcium, phosphorus, and intact plasma parathyroid hormone(PTH) should be measured in all patients with CKD and GFR <60 mL/min/1.73 m2. (EVIDENCE) The frequency of these measurements should be based on the stage of chronic kidney disease (Table 14). (OPINION) [Table indicated stage 3 CKD or more should be tested at least annually.] (Pg S52)

KDIGO Clinical Practice Guideline

3.1.1 We recommend monitoring serum levels of calcium, phosphorus, PTH, and alkaline phosphatase activity beginning in CKD stage 3 (1C). In children, we suggest such monitoring beginning in CKD stage 2 (2D). (page 523)

3.1.2 In patients with CKD stages 3–5D, it is reasonable to base the frequency of monitoring serum calcium, phosphorus, and PTH on the presence and magnitude of abnormalities, and the rate of progression of CKD (not graded).

Reasonable monitoring intervals would be:

In CKD stage 3: for serum calcium and phosphorus, every 6–12 months; (pg 525)

1c.18 National Guideline Clearinghouse or other URL: N/A

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? No

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias:

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: KDIGO rates this measure as Level 1 C. (Strong recommendation, low quality of evidence)

KDIGO distinguishes their recommendations as Level 1 or Level 2 grades.

A Level 1 grade is defined as a strong recommendation (“We recommend”). KDIGO intends this level of recommendation to be viewed from three points of view: From the patient’s standpoint, most people in this situation would want the recommended course of action and only a small proportion would not. From the clinician’s standpoint, most patients should receive the recommended course of action. From a policy standpoint, this recommendation can be adopted as policy in most situations.

Level 2 grade is defined as a suggestion. From the patient’s standpoint, the majority of people in this situation would want the recommended course of action, but many would not. From the clinician’s

standpoint, different choices will be appropriate for different patients and each patient needs help to arrive at a decision consistent with his or her values and preferences. From a policy standpoint, this recommendation is likely to require further discussion and debate before policy can be determined. KDIGO rates their level of evidence between A to D.

Grade A evidence is high. The true effect lies close to the estimate of its effect.

Grade B evidence is moderate. The true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different.

Grade C evidence is low. The true effect may be substantially different than the estimate of the effect.

Grade D evidence is very low. The estimate of the effect is very uncertain, and often will be far from the truth.

1c.23 Grade Assigned to the Recommendation: N/A

1c.24 Rationale for Using this Guideline Over Others: The NKF and KDIGO are highly regarded organizations whose guidelines are well respected within the medical community. Additionally, these guideline complimented the existing NQF guideline (0255), which recommends monitoring of serum phosphorous beginning at stage 3 kidney disease.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High **1c.26** Quality: High **1c.27** Consistency: High

1c.28 Attach evidence submission form:

1c.29 Attach appendix for supplemental materials:

Was the threshold criterion, *Importance to Measure and Report*, met?

(1a & 1b must be rated moderate or high and 1c yes) Yes ☒ No ☒

Provide rationale based on specific subcriteria:

For a new measure if the Committee votes NO, then STOP.

For a measure undergoing endorsement maintenance, if the Committee votes NO because of 1b. (no opportunity for improvement), it may be considered for continued endorsement and all criteria need to be evaluated.

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (**evaluation criteria**)

Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See [guidance on measure testing](#).

S.1 Measure Web Page (*In the future, NQF will require measure stewards to provide a URL link to a web page where current detailed specifications can be obtained*). Do you have a web page where current detailed specifications for this measure can be obtained? No

S.2 If yes, provide web page URL:

2a. RELIABILITY. Precise Specifications and Reliability Testing: H ☒ M ☒ L ☒ I ☒

2a1. Precise Measure Specifications. (*The measure specifications precise and unambiguous.*)

2a1.1 Numerator Statement (*Brief, narrative description of the measure focus or what is being measured about the target population, e.g., cases from the target population with the target process, condition, event, or outcome*):

Members with phosphorus level blood tests during the measurement year.

2a1.2 Numerator Time Window *(The time period in which the target process, condition, event, or outcome is eligible for inclusion):*

The measurement year.

2a1.3 Numerator Details *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, codes with descriptors, and/or specific data collection items/responses):*

Numerator Logic: A

[A] Members who received a phosphorus level blood test during the measurement year.

CPT-4 code(s): 80069, 84100

CPT-4 category II code(s): 3278F

2a1.4 Denominator Statement *(Brief, narrative description of the target population being measured):*

Members with at least 1 inpatient diagnosis of chronic kidney disease during the year prior to the measurement year or members with at least 2 diagnoses of chronic kidney disease in an outpatient setting during the measurement year or year prior (at least 1 of which must be during the year prior to the measurement year).

All physicians who saw the patient during the measurement year are scored on this measure.

2a1.5 Target Population Category *(Check all the populations for which the measure is specified and tested if any):* Adult/Elderly Care

2a1.6 Denominator Time Window *(The time period in which cases are eligible for inclusion):*

Year prior to the measurement year.

We apologize if this was not clearly stated; the continuous enrollment requirement for this measure is the 12 month period of the measurement year. Diagnoses in the year prior to the measurement year are necessary to qualify for the denominator, but there is no continuous enrolment requirement during the year prior to the measurement year.

2a1.7 Denominator Details *(All information required to identify and calculate the target population/denominator such as definitions, codes with descriptors, and/or specific data collection items/responses):*

Denominator Logic: (A or (B and C) or D) and CE

[CE] Members continuously enrolled during the measurement year.

[A] Members with at least 1 inpatient encounter with chronic renal disease (Stage >= 3) during the year prior to the measurement year.

Chronic Renal Disease:

2a1.17-18. Type of Score: [Rate/proportion](#)

2a1.19 Interpretation of Score (Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score):
[Better quality = Higher score](#)

2a1.20 Calculation Algorithm/Measure Logic(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.):

The first step in calculating a performance score utilizing this measure is to identify the denominator, or patients with chronic kidney disease. Next, excluded patients are removed from the denominator; exclusions for this measure include patients on dialysis or hospice as well as patients who were hospitalized during the numerator timeframe and did not fulfill the numerator criteria. Next, the numerator, or the rate of phosphorus measurement, can be determined. Calculating the numerator/denominator ratio provides the rate for a health plan, provider, etc. As this is a process measure, there is no risk adjustment necessary.

Care : Clinic/Urgent Care, Ambulatory Care : Clinician Office

2a2. Reliability Testing. *(Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.)*

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):*

Data from commercial health plans were used to generate rates of serum phosphorus testing. Included health plans range from 3 to 7 million members.

Plan A: 2,222 physicians, treating 31,935 CKD patients

Plan B: 6,645 physicians, treating 35,543 patients

We cannot provide descriptive information on the stage of CKD. Our algorithm determines whether or not the patient suffers from CKD stage = 3, however, we cannot discriminate between stages 3, 4, and 5 using administrative data.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale):*

First, we calculated the reliability of physician performance measurement based a recently published paper [Adams JL, The Reliability of Provider Profiling: A Tutorial, Santa Monica, Calif.: RAND Corporation, TR-653-NCQA, 2009.] This method address how confidently we can distinguish the performance of one physician from another. We estimated reliability using the beta binomial model. The beta-binomial model is a natural fit for estimating the reliability of simple binary pass/fail rate measures. An example, is that the provider is assigned a member who did or did not receive a lab test. HEDIS measures and this measure are binary measures. Basically, there are three main drivers of reliability: sample size, difference between physicians, and measurement error. The physician-to-physician variance was estimated using a publically available SAS macro (MACRO BETABIN Version 2.2, March 2005; Author, Ian Wakeling, QI Statistics). Then we calculated physician-specific reliability scores after applying a minimum denominator threshold of 10. Lastly, we obtained the mean physician reliability score. Our reliability estimates is ≥ 0.70 , which shows that our measures have good reliability. We can confidently distinguish the performance of one physician from another.(Table 1)

Second, testing rates for Plans A and B were compared for stability over the course of two years. Plan A consisted of data from 2008 and 2009. For Plan B, year one included data from 7/1/08 to 6/30/09 and year two consisted of data from 7/1/09 to 6/30/10.(Table 2)

We do agree that a patient-level analysis of reliability would have been ideal. The outcome of our measure at the patient level is 1/0, whereas the outcome for physicians is a continuous percentage of patients that received a laboratory test. Unfortunately, using a 1/0 outcome to determine correlation is difficult because one change between 1 and 0 can have much larger consequences than a change in a continuous percentage.

Third, to investigate the test-retest reliability of the data, we investigated the correlation of providers' scores (who met minimal denominator threshold of 25) between two years for two plans in the PPO setting. We found that the test-retest reliability is high based on Pearson's correlation coefficient ($c > 0.7$) (Table 3)

2a2.3 Testing Results (*Reliability statistics, assessment of adequacy in the context of norms for the test conducted*):

Table 1:

Plan A reliability score = 0.72, Plan B reliability score = 0.88

Table 2

PLAN	Year 1 Rate	Year 2 Rate	Year 1 Denominator	Year 2 Denominator
Plan A	43.6%	44.5%	6487	6965
Plan B	46.3%	45.8%	7506	7770

Table 3: Test-retest reliability

Pearson's correlation coefficient for plan A 0.816

Pearson's correlation coefficient for plan B 0.963

We provided was the average reliability score of physicians.

We applied a denominator threshold 10. The distribution of physician reliability scores is as follows:

Plan A: n=835, mean = 0.72, standard deviation=0.12, minimum=0.49, maximum=1.00,
25th percentile=0.62, 75th percentile=0.80, 90th percentile=0.89

Plan B: n=664, mean = 0.81, standard deviation=0.10, minimum=0.67, maximum=1.00,
25th percentile=0.73, 75th percentile=0.88, 90th percentile=0.97

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H M L I

2b1.1 Describe how the measure specifications (measure focus, target population, and exclusions) are consistent with the evidence cited in support of the measure focus (criterion 1c) and identify any differences from the evidence:

The patient population addressed by measure is patients with chronic kidney disease, not on dialysis; there are no differences between the measure focus and measure target population. Both the measure focus and target population are consistent with the evidence.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.*)

2b2.1 Data/Sample (*Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

2008 Data from six geographically diverse commercial health plans were used to generate rates of serum phosphorus testing. The sizes of the included health plans range from 580,000 members, to 7 million members.

2b2.2 Analytic Method (*Describe method of validity testing and rationale; if face validity, describe systematic assessment*):

To assess for the validity of our measures, we first assessed for face validity. In other words, we examine whether the construction of the measures can accurately capture the denominator, exclusion, and numerator.

Accuracy of Denominator

The IMS denominator algorithm to identify patient with chronic renal disease (stage III or greater, GFR <

60ml/min/1.73 m²) is consistent with algorithms in the literature which were able to identify patients with CKD with > 97% specificity when compared to data obtained by other sources (i.e, creatinine values).[1-3]

Accuracy of Exclusion

For the calcium and phosphorus measures, we excluded patients who were on dialysis and hospitalized during the numerator time period. We cannot accurately capture the receipt of Ca and PO₄ laboratory tests because of bundled coding. The accuracy of capturing patients who were dialyzed or hospitalized is high because hospitalizations and dialysis are costly and reimbursement for these events would be completely dependent upon the providers submitting the claims. It would be difficult to submit fraudulent claims for hospitalization or dialysis because of the high cost of these services. Health plans scrutinize these patients by conducting utilization reviews and enrolling these patients in disease management programs.

Accuracy of Numerator

The accuracy of assessing whether Ca, PO₄, and PTH tests were done by routine laboratory would also be high because submitting these claims would be tied to reimbursement, especially in the PPO setting. Although it is possible for providers to submit fraudulent claims for factitious tests or procedures, we believe this is less likely to occur in the laboratory testing.

Second, we ran the algorithm for serum phosphorus testing on six plans. Denominator size and rate were calculated for each plan.(Table 1)

Third, we compare the rates generated using this algorithm to annual rates for serum phosphorus testing found in the literature. We found the rates we obtain to be consistent with rates found in the literature. (Table 2)

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment):*

Table 1: Phosphorus testing rates using internal administrative data

PLAN	RATE	DENOMINATOR
Plan A	43.59%	6487
Plan B	46.32%	7506
Plan C	51.38%	506
Plan D	29.53%	10911
Plan E	39.08%	2838
Plan F	41.71%	5335
Average Rate:		41.94%
		Standard Deviation: 7.39%
		Average Denominator: 5597

Table 2: Serum Phosphorus Testing Rates in the Literature.

Several U.S. based studies have examined prevalence of serum phosphorus testing among patients with CKD, and have generally reported rates of testing in commercial settings between 30 and 70%.[1]

However, these studies vary greatly by provider specialty (primary care vs nephrology), data source (chart review vs administrative claims), observation period, and kidney function of study cohort members.

Testing rates vary significantly by specialty. Among primary care providers, rates are lowest among non-nephrology providers (30%) (data based on chart review.[2] Rates of 50% and 53% among samples consisting of 1/2 Primary care and 1/2 nephrology(based on administrative claims and chart review respectively) have been reported, [3,4] Rates reported for nephrologists are 69% and 70% for members seen only by nephrologists (based on administrative claims).[5,6]

However, a recent administrative claims-based study by Philipneri et al. reported rates of serum phosphorus testing as low as 1.9% among patients seen by primary care providers, and 38.2% among those seen by Nephrologists.[1] However, this study was limited to patients with Stage 3 CKD, (in which lower testing rates would be expected) whereas the majority of other studies have include CKD up to stage 5.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions (*Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*): Data from a commercial health plan were used to generate rates of serum phosphorus testing. The data spanned from 7/1/09 to 6/30/10 and included a membership of 7 million members.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference*):

Using data from this plan, the rates and numbers of excluded patients were determined. Exclusions for this measure include patients on dialysis, in hospice, or those with an inpatient stay. We do not believe that a sensitivity analysis is relevant in this situation, given that these exclusions were determined a priori based on clinical acumen and knowledge of administrative claims data.

2b3.3 Results (*Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses*):

Prior to exclusions, the denominator was 10192. Following the 3 exclusions, the denominator was 7770.

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample (*Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

N/A

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables*):

N/A

2b4.3 Testing Results (*Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata*):

N/A

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment: This is a process measure, therefore, there is no need for risk-adjustment.

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample (*Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

The data utilized for this analysis were from a plan with approximately 7 million members. The sample included a final denominator of 7770 patients. The data spanned from 7/1/09 to 6/30/10.

2b5.2 Analytic Method (*Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance*):

In order to differentiate provider performance, we first identify individual providers and determine their rates. These individual rates can then be analyzed to determine mean and range, as well as the standard deviation. We can also divide the providers by quartile in order to determine the statistical significance of performance between quartiles.

2b5.3 Results (*Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningful differences in performance*):

We measured provider performance in 2 plans. For the providers to be scored, we applied a minimal denominator of 10.

Plan A

n = 644 (number of providers scored)

Mean score = 55%, median = 50%, SD = 24%, Min = 0, Max = 100%

25 percentile = 36%, 75th percentile = 69%

Plan B

n = 835 (number of providers scored)

Mean = 52%, Median = 53%, SD = 18%, Min = 0%, Max = 100%

25th percentile = 41%, 75th percentile = 63%

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample (*Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

N/A. Administrative data is the only source for this measure.

2b6.2 Analytic Method (*Describe methods and rationale for testing comparability of scores produced by*

the different data sources specified in the measure):

N/A. Administrative data is the only source for this measure.

2b6.3 Testing Results (Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted):

N/A. Administrative data is the only source for this measure.

2c. Disparities in Care: H ☐ M ☐ L ☐ I ☐ NA ☐ (If applicable, the measure specifications allow identification of disparities.)

2c.1 If measure is stratified for disparities, provide stratified results (Scores by stratified categories/cohorts): N/A

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:

N/A

2.1-2.3 Supplemental Testing Methodology Information:

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met? (Reliability and Validity must be rated moderate or high) Yes ☐ No ☐
Provide rationale based on specific subcriteria:

If the Committee votes No, STOP

3. USABILITY

Extent to which intended audiences (e.g., consumers, purchasers, providers, policy makers) can understand the results of the measure and are likely to find them useful for decision making. (**evaluation criteria**)

C.1 Intended Actual/Planned Use (Check all the planned uses for which the measure is intended): Public Reporting, Quality Improvement (Internal to the specific organization)

3.1 Current Use (Check all that apply; for any that are checked, provide the specific program information in the following questions): Quality Improvement (Internal to the specific organization)

3a. Usefulness for Public Reporting: H ☐ M ☐ L ☐ I ☐ (The measure is meaningful, understandable and useful for public reporting.)

3a.1. Use in Public Reporting - disclosure of performance results to the public at large (If used in a public reporting program, provide name of program(s), locations, Web page URL(s)). If not publicly reported in a national or community program, state the reason AND plans to achieve public reporting, potential reporting programs or commitments, and timeline, e.g., within 3 years of endorsement: **[For Maintenance** – If not publicly reported, describe progress made toward achieving disclosure of performance results to the public at large and expected date for public reporting; provide rationale why continued endorsement should be considered.]

This measure is designed to be used for public reporting and incentive-based performance programs. Our organization is not a health plan, and thus, is unable to implement a public reporting program. However, we are currently in discussions with various health plans to encourage the use of this measure for public reporting.

3a.2. Provide a rationale for why the measure performance results are meaningful, understandable, and useful for public reporting. If usefulness was demonstrated (e.g., focus group, cognitive testing), describe the data, method, and results: Bone mineral disorders are common in patients with chronic kidney disease, and have the potential for severe adverse impact on both mortality and morbidity. The diagnosis of bone mineral disorders is dependent on laboratory testing of calcium, phosphorus, and parathyroid hormone levels. This measure reports the percentage of patients with chronic kidney disease who received the indicated quality of care. A higher score indicates higher quality of care. The construction of this measure is similar to many other well recognized and established measures (e.g., percent of diabetics who received Hba1c).

Public reporting of physician compliance on this measure would improve physician performance potentially through two pathways. In one pathway stakeholders, such as patients, consumers, purchasers, and health plans can compare provider performance via publicly released data for this measure and reward better performance with increased volume. In the second pathway, these data can assist medical groups or physicians to identify areas to target for improvement. Public reporting of physician compliance with this measure may also increase patient awareness of the importance of laboratory testing for calcium, phosphorus, and parathyroid hormone in the setting of chronic kidney disease.

3.2 Use for other Accountability Functions (payment, certification, accreditation). If used in a public accountability program, provide name of program(s), locations, Web page URL(s): This measure is currently not being used in any of these capacities. Most health plans that we had approached were interested in using this measure in pay-for-performance or transparency programs.

3b. Usefulness for Quality Improvement: H● M● L● I●

(The measure is meaningful, understandable and useful for quality improvement.)

3b.1. Use in QI. If used in quality improvement program, provide name of program(s), locations, Web page URL(s):

[For Maintenance – If not used for QI, indicate the reasons and describe progress toward using performance results for improvement].

This measure is currently in use by BlueCross BlueShield of Alabama for quality improvement through their program, Physician Quality and Transparency Program. The results are posted on an internal website that allows the physicians to view their performance and see how it compares to other physicians within the plan.

The URL for this program is:

<http://www.bcbsal.org/providers/physicianqualityandtransparencyprogram/index.cfm>

3b.2. Provide rationale for why the measure performance results are meaningful, understandable, and useful for quality improvement. If usefulness was demonstrated (e.g., QI initiative), describe the data, method and results:

In addition to reporting the percentage of patients with chronic kidney disease who received the indicated quality of care for this measure, IMS Health has developed an online tool (currently in use by health plans) that allows physicians to view the names and medical records of patients who did not receive the indicated quality of care. This tool can aid physicians in their quality improvement efforts.

Overall, to what extent was the criterion, Usability, met? H● M● L● I●

Provide rationale based on specific subcriteria:

4. FEASIBILITY

Extent to which the required data are readily available, retrievable without undue burden, and can be implemented for performance measurement. **(evaluation criteria)**

4a. Data Generated as a Byproduct of Care Processes: H● M● L● I●

4a.1-2 How are the data elements needed to compute measure scores generated? (Check all that

See Guidance for Definitions of Rating Scale: H=High; M=Moderate; L=Low; I=Insufficient; NA=Not Applicable

Created on: 05/24/2021 at 05:30 PM

apply).

Data used in the measure are:

Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims)

4b. Electronic Sources: H ☐ M ☐ L ☐ I ☐

4b.1 Are the data elements needed for the measure as specified available electronically (*Elements that are needed to compute measure scores are in defined, computer-readable fields*): ALL data elements in electronic claims

4b.2 If ALL data elements are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources:

4c. Susceptibility to Inaccuracies, Errors, or Unintended Consequences: H ☐ M ☐ L ☐ I ☐

4c.1 Identify susceptibility to inaccuracies, errors, or unintended consequences of the measurement identified during testing and/or operational use and strategies to prevent, minimize, or detect. If audited, provide results:

This is a administrative claims-based quality indicator with certain potential biases, including coding variation between providers and missing data. Nevertheless, administrative claims data is the widely available and has been used to effectively examine and document patterns of health care utilization, detect opportunities to improve quality of care, estimate incidence of disease, and even assess outcomes of pharmaceutical, radiological, and surgical procedures.

4d. Data Collection Strategy/Implementation: H ☐ M ☐ L ☐ I ☐

A.2 Please check if either of the following apply (*regarding proprietary measures*): Proprietary measure

4d.1 Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues (e.g., fees for use of proprietary measures):

IMS Health has developed an online tool (currently in use by health plans), which allows physicians the opportunity to supplement their quality scores through self-report via a secured web site. Via this website, physicians are able to identify specific patients with whom they had an office visit during the measurement period and who reportedly did not have the indicated quality care. Physicians can then review their charts to verify whether in fact the quality care was performed. The physician can then manually enter corrections to the patient record via the website, indicating that the quality care was done. This data is subject to clinical review prior to acceptance. The hybrid quality score (via administrative claims and self report) can be updated on a quarterly basis.

Overall, to what extent was the criterion, *Feasibility*, met? H ☐ M ☐ L ☐ I ☐
Provide rationale based on specific subcriteria:

OVERALL SUITABILITY FOR ENDORSEMENT

Does the measure meet all the NQF criteria for endorsement? Yes ☐ No ☐

Rationale:

If the Committee votes No, STOP.

If the Committee votes Yes, the final recommendation is contingent on comparison to related and competing measures.

5. COMPARISON TO RELATED AND COMPETING MEASURES

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure before a final recommendation is made.

5.1 If there are related measures (*either same measure focus or target population*) or competing measures (*both the same measure focus and same target population*), list the NQF # and title of all related and/or competing measures:

5a. Harmonization

5a.1 If this measure has EITHER the same measure focus OR the same target population as [NQF-endorsed measure\(s\)](#): Are the measure specifications completely harmonized?

5a.2 If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden:

5b. Competing Measure(s)

5b.1 If this measure has both the same measure focus and the same target population as NQF-endorsed measure(s):

Describe why this measure is superior to competing measures (*e.g., a more valid or efficient way to measure quality*); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible):

N/A. There are no measures that share the same focus and target population. Although measure 0255 by CMS measures phosphorus levels, it does so in the dialysis population. our measure focuses on the measurement of serum phosphorus in chronic renal disease members who are not on dialysis in an effort to prevent complications of altered bone metabolism commonly seen in CKD.

CONTACT INFORMATION

Co.1 Measure Steward (Intellectual Property Owner): IMS Health, 21650 Oxnard Street, Suite 1850, Woodland Hills, California, 91367

Co.2 Point of Contact: Dan, Malloy, PhD, dmalloy@us.imshealth.com, 800-465-6575-

Co.3 Measure Developer if different from Measure Steward: IMS Health, 21650 Oxnard Street, Suite 1850, Woodland Hills, California, 91367

Co.4 Point of Contact: Irina, Yermilov, MD, MPHTM, iyermilov@us.imshealth.com, 818-676-2835-

Co.5 Submitter: Irina, Yermilov, MD, MPHTM, iyermilov@us.imshealth.com, 818-676-2835-, IMS Health

Co.7 Public Contact: Dan, Malloy, PhD, dmalloy@us.imshealth.com, 800-465-6575-, IMS Health

ADDITIONAL INFORMATION

Workgroup/Expert Panel involved in measure development

Ad.1 Provide a list of sponsoring organizations and workgroup/panel members' names and organizations. Describe the members' role in measure development.

N/A

Ad.2 If adapted, provide title of original measure, NQF # if endorsed, and measure steward. Briefly describe the reasons for adapting the original measure and any work with the original measure steward: N/A

Measure Developer/Steward Updates and Ongoing Maintenance

Ad.3 Year the measure was first released: 2008

Ad.4 Month and Year of most recent revision: 11, 2010

Ad.5 What is your frequency for review/update of this measure? Annually

Ad.6 When is the next scheduled review/update for this measure? 11, 2011

Ad.7 Copyright statement: ©2011 IMS Health Incorporated or its affiliates. All Rights Reserved.

Ad.8 Disclaimers:

Ad.9 Additional Information/Comments: Changes were made to the following sections of this NQF form in November 2011:

Are you proposing this measure for both physician level measurement and health plan (2a1.34-35)?

Yes, this measure can be utilized for both plan and physician level measurement.

I see the additional reliability testing you did for physician performance scores provided in 2a2 is based on one method referenced in the Measure Testing Task Force report.

2a2.1 – please provide more descriptive information about the data used for the analyses – number of physicians treating CKD patients and number of CKD patients included in the analysis from each data set, any descriptive info on stage of CKD

Plan A: 2,222 physicians, treating 31,935 CKD patients

Plan B: 6,645 physicians, treating 35,543 patients

We cannot provide descriptive information on the stage of CKD. Our algorithm determines whether or not the patient suffers from CKD stage = 3, however, we cannot discriminate between stages 3, 4, and 5 using administrative data.

2a2.3 – results for reliability testing – provide the distribution of reliability estimates across the sample of physicians and indicate that the one estimate you provided was the average

Yes, the one we provided was the average reliability score of physicians.

We applied a denominator threshold 10. The distribution of physician reliability scores is as follows:

Plan A: n=835, mean = 0.72, standard deviation=0.12, minimum=0.49, maximum=1.00,
25th percentile=0.62, 75th percentile=0.80, 90th percentile=0.89

Plan B: n=664, mean = 0.81, standard deviation=0.10, minimum=0.67, maximum=1.00,
25th percentile=0.73, 75th percentile=0.88, 90th percentile=0.97

2a2. Correlation of performance scores over time is not generally thought of as a test of reliability. Test-retest reliability generally is about repeating the same items in the same individuals in a period of time where changes are not expected. In this analysis, the patients are likely to be different and provider practices also may be different, especially when talking about quality performance measures where the intent is improvement. Additionally, aggregate plan level performance provides no information about physician level performance measures. What does this demonstrate about reliability?

We do agree that a patient-level analysis of reliability would have been ideal. The outcome of our measure at the patient level is 1/0, whereas the outcome for physicians is a continuous percentage of patients that

received a laboratory test. Unfortunately, using a 1/0 outcome to determine correlation is difficult because one change between 1 and 0 can have much larger consequences than a change in a continuous percentage.

2a1.4-7 Denominator

How are patients identified with particular physicians for physician performance scores?

All physicians who saw the patient during the measurement year are scored on this measure.

2a1.6 – Time window for the denominator. Don't you need to start with patients enrolled in the measurement year. Isn't the 12-month prior for purposes of looking for CKD dx?

We apologize if this was not clearly stated; the continuous enrollment requirement for this measure is the 12 month period of the measurement year. Diagnoses in the year prior to the measurement year are necessary to qualify for the denominator, but there is no continuous enrollment requirement during the year prior to the measurement year.

On September 19, 2011 NQF committee meeting we were asked to provide with the following information:

1) Any data at the provider level to support this measure?

We added the following information to 2b5.3.

We measured provider performance in 2 plans. For the providers to be scored, we applied a minimal denominator of 10.

Plan A

n = 644 (number of providers scored)

Mean score = 55%, median = 50%, SD = 24%, Min = 0, Max = 100%

25 percentile = 36%, 75th percentile = 69%

Plan B

n = 835 (number of providers scored)

Mean = 52%, Median = 53%, SD = 18%, Min = 0%, Max = 100%

25th percentile = 41%, 75th percentile = 63%

2) Provide a rationale for your reliability and validity methods and results in section 2a2 and 2b2.

We updated our reliability and validity methods and results in the respective sections 2a2 and 2b2.

For the calculation of reliability, we added the calculation of physician reliability score developed by John Adman for NCQA HEDIS Measures. [Citation: Adams JL, The Reliability of Provider Profiling: A Tutorial, Santa Monica, Calif.: RAND Corporation, TR-653-NCQA, 2009.] This method tells how confidently one can distinguish the performance of one physician from another; this is a measurement of signal to noise.

To assess validity, we first examined face validity. We provided the citation of the literature that examined the sensitivity and specificity of our current algorithm to capture the denominator of CKD patients compared to lab data.

References for face-validity.
